

Stock Market Performance & Trading Analytics Dashboard

1. Project Overview

Stock Market Performance & Trading Analytics Dashboard is a Power BI portfolio project focused on turning stock-market data into an interactive analytical experience. The report brings together performance metrics, trading-related analysis, trends, and company-level exploration in a two-page dashboard layout.

The project demonstrates an end-to-end business intelligence workflow: preparing source data, building an analytical layer, creating measures, designing interactive visuals, and presenting insights in a format suitable for portfolio and recruiter review.

2. Project Goals

- Provide a clear visual view of stock-market performance.
- Analyze price and trading activity trends over time.
- Enable company-level comparison and focused exploration.
- Use interactive slicers and responsive visuals for self-service analysis.
- Demonstrate practical Power BI, Power Query, DAX, and data-storytelling skills.

3. Technology Stack

Technology	Role in the project
Microsoft Power BI	Dashboard development, visualization, filtering, and report presentation
Power Query	Data preparation and transformation workflow
DAX	Calculated measures and analytical logic
CSV / Excel data	Source data for stock-market analysis
GitHub	Portfolio hosting, project organization, and version history

4. Dataset & Data Preparation

The project uses a stock-market dataset maintained in the repository's Dataset folder. The data supports analysis of stock prices, trading activity, time-based movements, and company-level performance.

Within Power BI, the data is prepared for analysis through appropriate data-type handling, cleaning, transformation, and structuring required by the dashboard visuals and calculations.

The exact source columns and individual Power Query steps are not reproduced here because the PBIX binary is not directly inspectable in this environment. Technical details are therefore described only at the level that can be supported without guessing.

5. Dashboard Structure

Page 1 - Performance Overview

The first page acts as the primary market-performance view. It emphasizes high-level metrics, trend analysis, and an at-a-glance understanding of stock performance. Interactive controls help users focus

the report on the relevant selection.

Page 2 - Trading Analytics

The second page provides a deeper analytical perspective centered on trading activity and comparisons. It complements the overview page and supports more focused exploration of the data.

6. Key Dashboard Capabilities

- Interactive slicers for user-driven filtering.
- Dynamic visuals that respond to selected filters.
- Time-based trend analysis.
- Company-level comparison.
- KPI-oriented performance monitoring.
- Separate overview and analytical pages for clearer storytelling.

7. Analytical Areas Covered

Area	Purpose
Price Performance	Understand stock price movement and performance patterns
Trading Activity	Review activity-related market behavior
Time Trends	Identify changes and patterns over the available periods
Company Comparison	Compare selected companies or market entities
Interactive Analysis	Explore the report through slicers and responsive visuals

8. Business / Portfolio Value

From a portfolio perspective, the project shows the ability to take raw analytical data and turn it into a usable decision-support dashboard. It highlights skills that are relevant to data analyst, business intelligence, and Power BI-focused roles: data preparation, visualization, interactive report design, metric development, and analytical storytelling.

9. Project Workflow

1	Import stock-market data
2	Clean and transform data
3	Prepare the analytical model
4	Create calculated measures
5	Build dashboard visuals
6	Add slicers and interactivity
7	Validate the report and publish project assets on GitHub

10. GitHub Repository Structure

■■■ Dataset/

■■■ Screenshots/

■■■ Documentation/

The structure separates the PBIX report, source data, dashboard images, and supporting documentation so visitors can understand and navigate the project quickly.

11. Resume & Portfolio Positioning

This project is suitable for inclusion under Projects on a data analytics / data science resume. The strongest portfolio narrative is to emphasize the business problem, dashboard interactivity, Power BI workflow, and the ability to turn market data into actionable visual analysis.

12. Future Enhancements

- Add advanced return, risk, and volatility metrics.
- Introduce additional technical indicators.
- Expand drill-through and company-detail analysis.
- Add automated refresh where the data source supports it.
- Document the exact table relationships and DAX measures from the PBIX for a complete technical specification.

13. Conclusion

The Stock Market Performance & Trading Analytics Dashboard is a practical Power BI portfolio project that demonstrates the conversion of stock-market data into an interactive analytical product. Its two-page design, filtering capabilities, and market-focused analysis make it suitable for showcasing data visualization and business intelligence skills on GitHub and in professional applications.
